Decoding New Residential Behavior: GPS-Based Detection of Working from Home and Third Places

Inessa Tregubova
Supervisor: Prof. Daniel Felsenstein
Department of Spatial Science · Hebrew University of Jerusalem

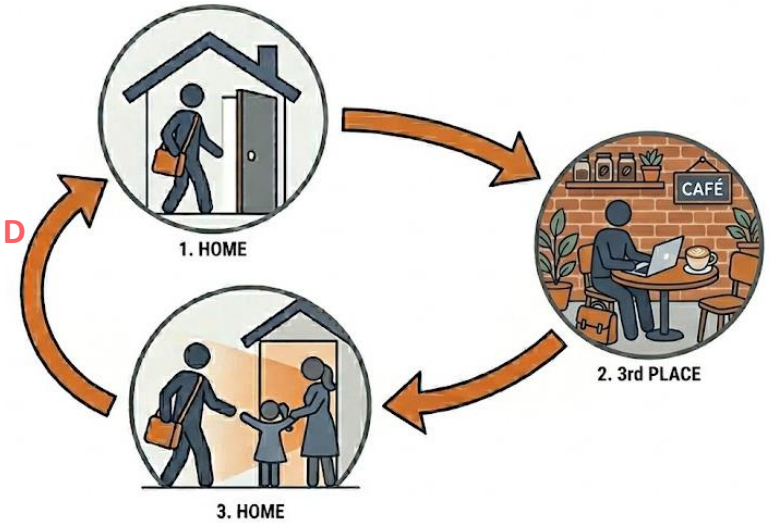

From "home-work-home" to "home-third place-home"

COVID-19 reshaped the urban triad. Hybrid schedules brought ~30% of US knowledge work home — and turned cafés, libraries and community centers into office substitutes.

PRE-COVID TRIAD

POST-COVID PATTERN

RESEARCH QUESTION

How do remote-work dynamics and new third places influence residential behavior and housing market across TAM neighborhoods?

How WFH changes cities

Three channels through which remote-work behavior reshapes urban form and public services.

01

Commuting behavior

Less load on public transit

Residents stay home more days per week — reducing peak-hour congestion and freeing capacity on the public-transit network.

02

Residential choice

Re-sorting of where people live

No premium for proximity to the CBD: residents move toward suburbia and amenity-rich periphery, redrawing the rental price gradient.

03

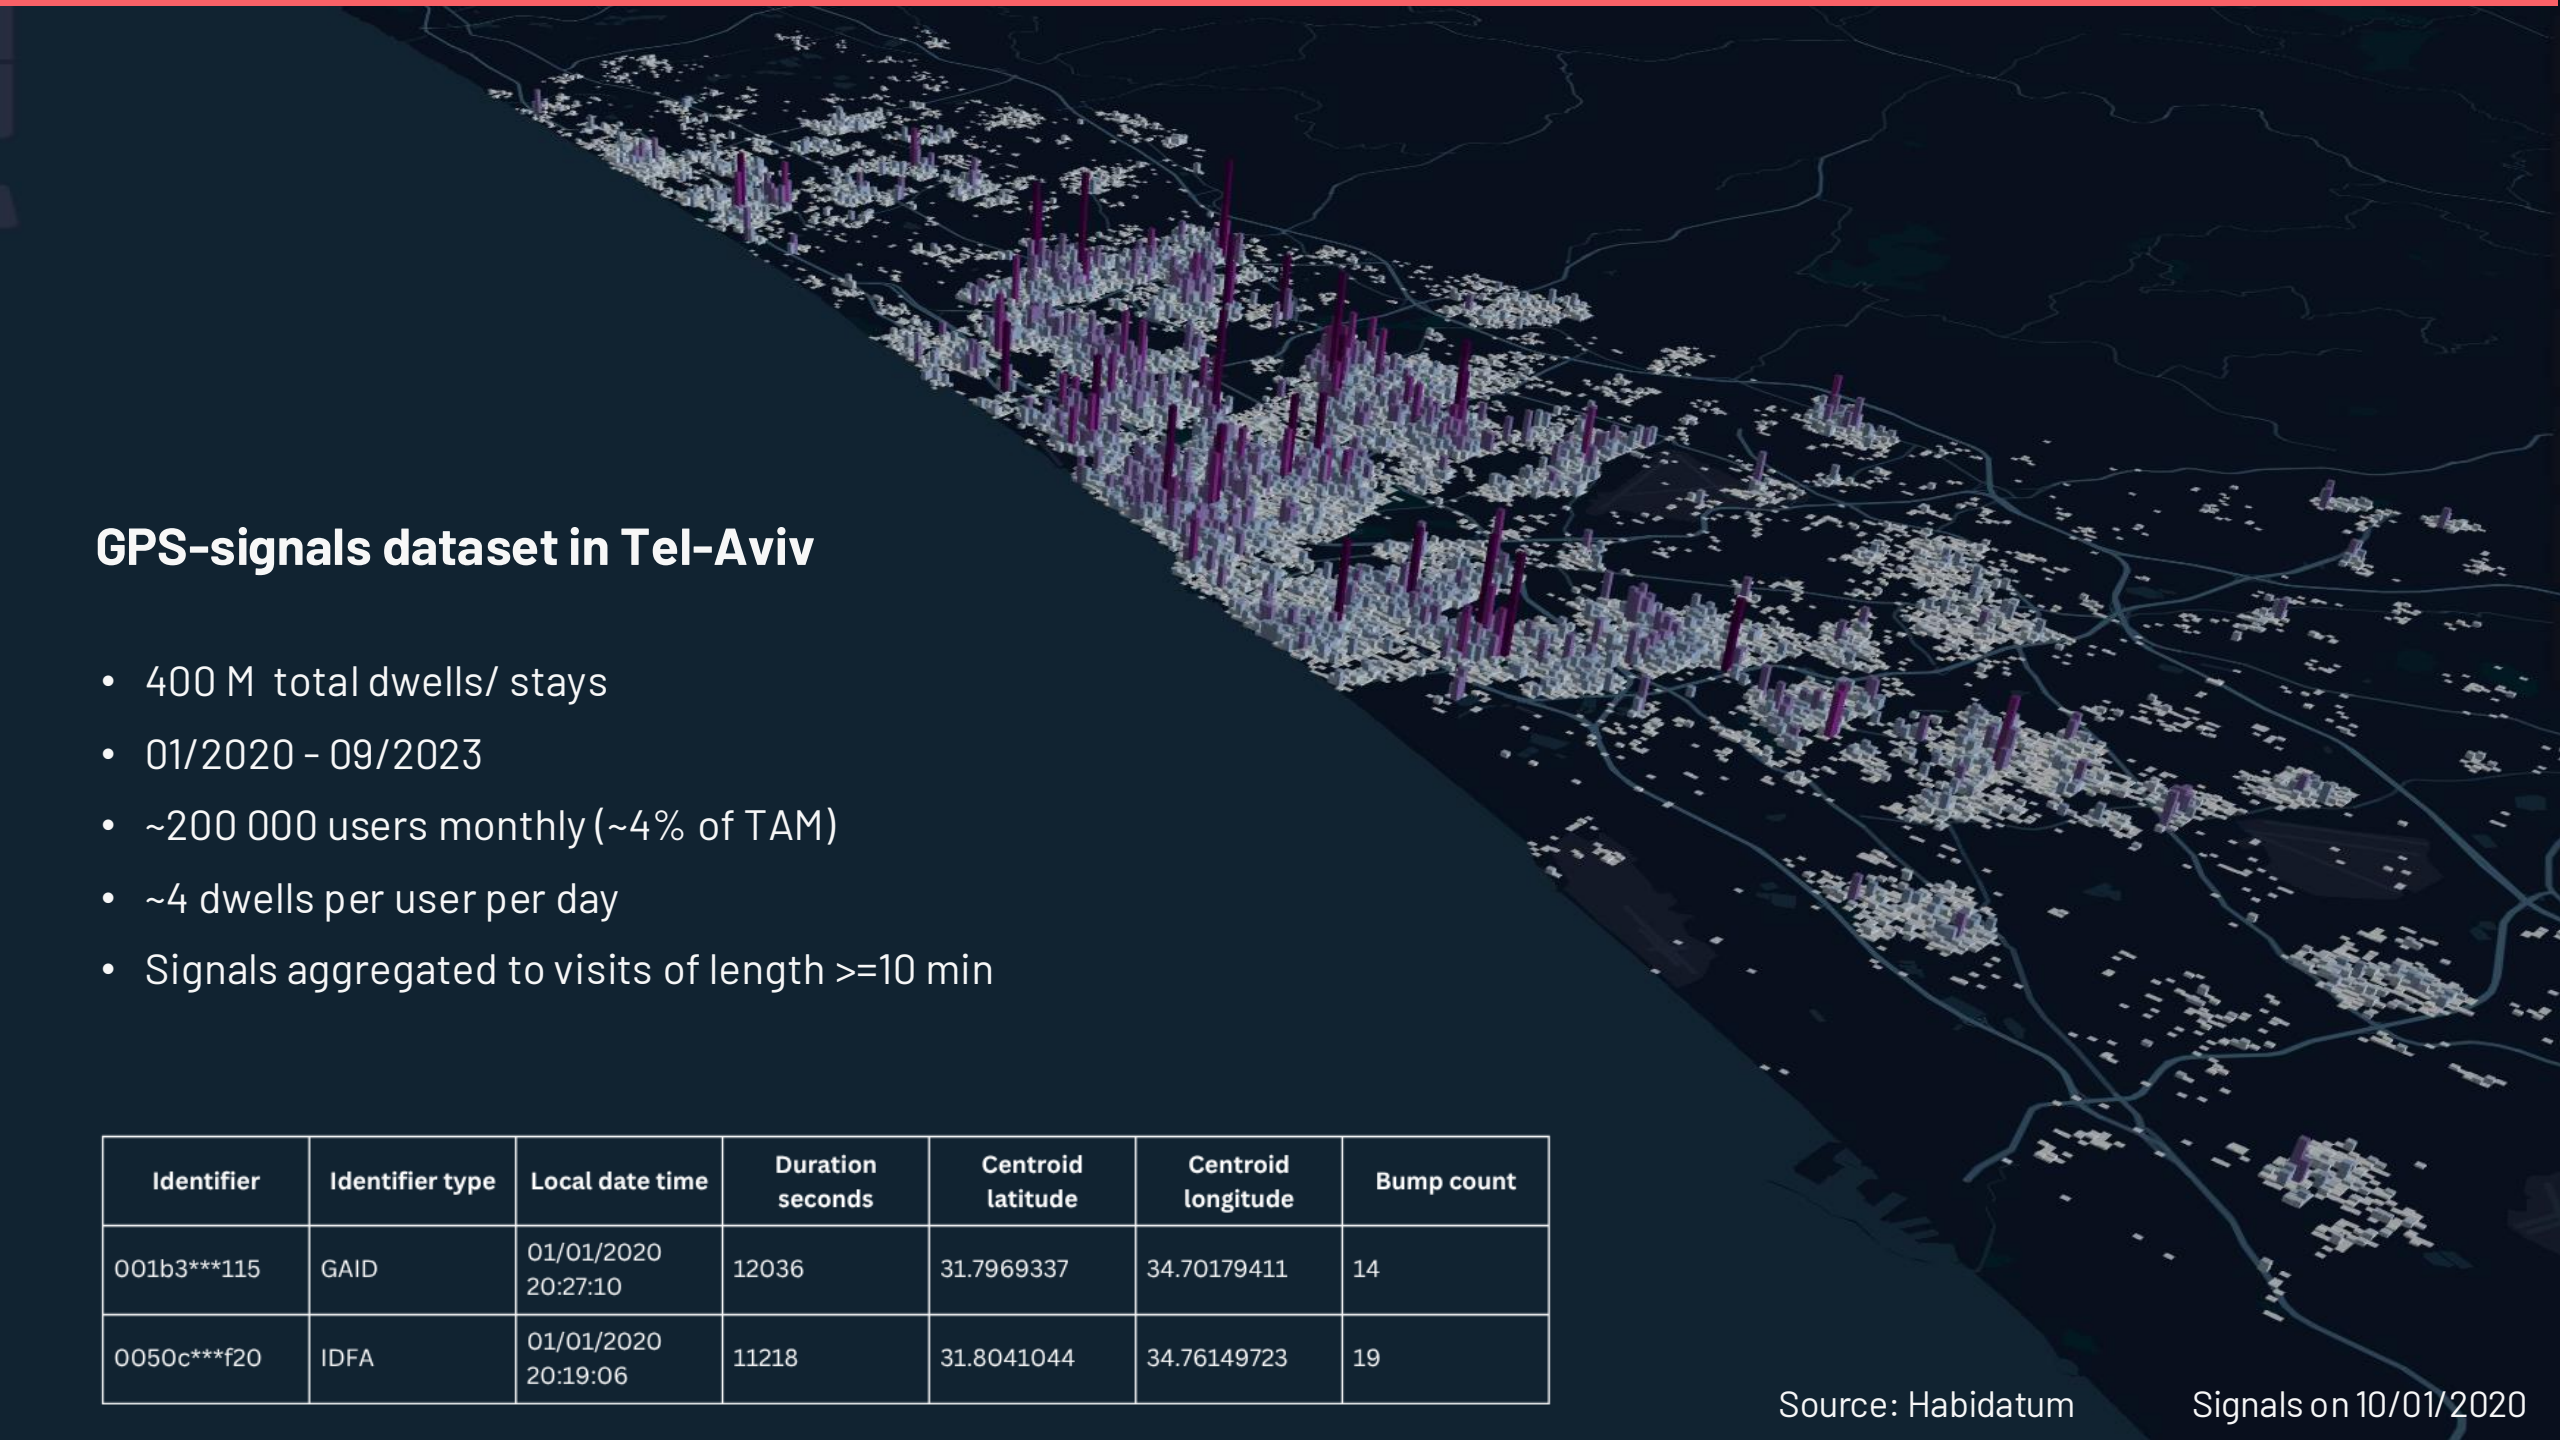

Local development

Growth of neighborhood services

Demand for local cafés, shops, parks and community space rises — triggering new openings, mixed-use zoning and infrastructure upgrades.

GPS-signals dataset in Tel-Aviv

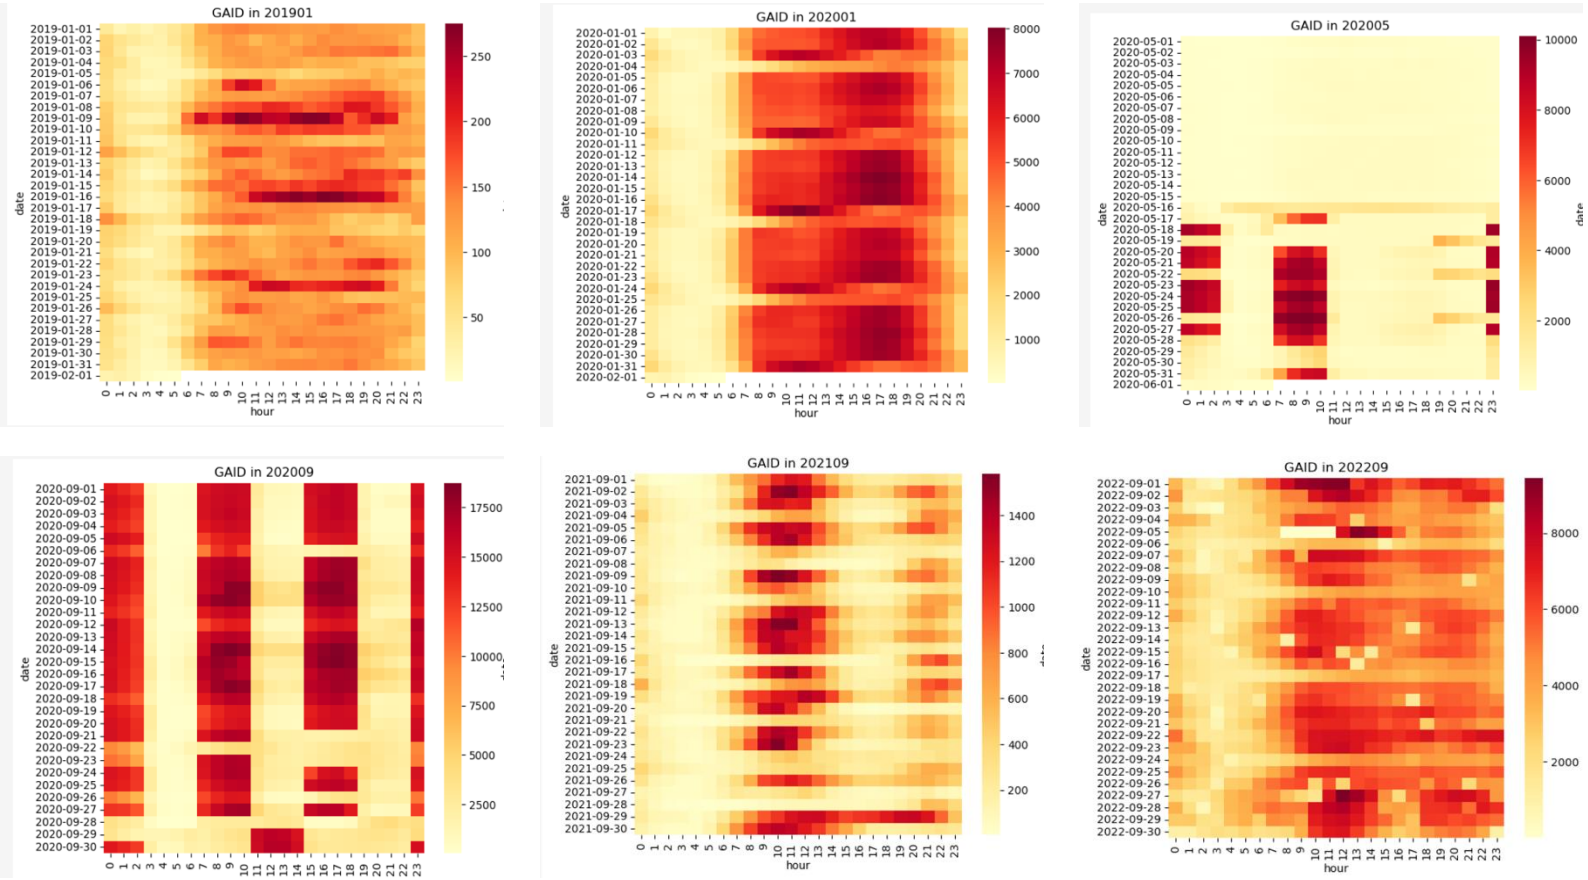

- 400 M total dwells/ stays
- 01/2020 - 09/2023
- ~200 000 users monthly (~4% of TAM)
- ~4 dwells per user per day
- Signals aggregated to visits of length >=10 min

Identifier	Identifier type	Local date time	Duration seconds	Centroid latitude	Centroid longitude	Bump count
001b3***115	GAID	01/01/2020 20:27:10	12036	31.7969337	34.70179411	14
0050c***f20	IDFA	01/01/2020 20:19:06	11218	31.8041044	34.76149723	19

Signals on 10/01/2020

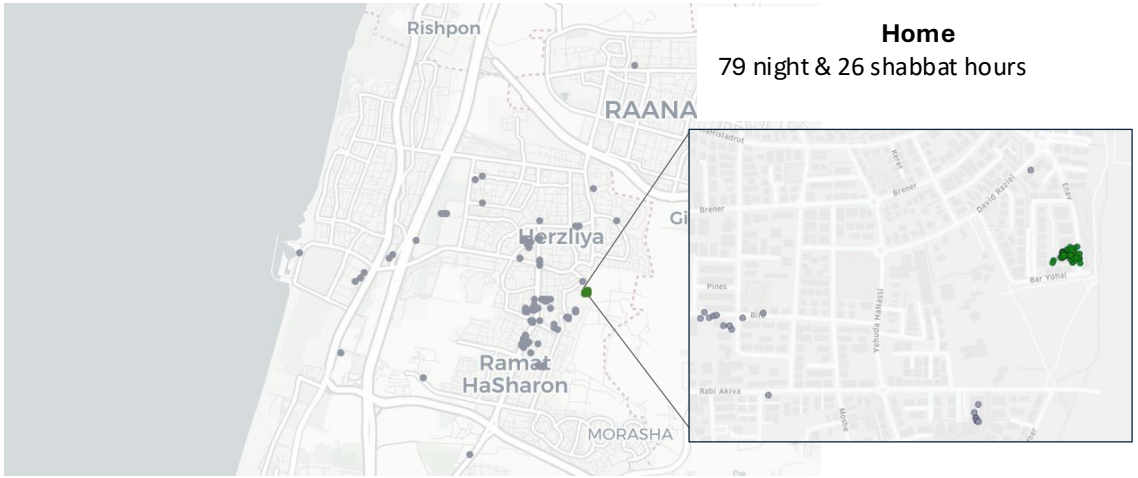

Signals are not evenly distributed in time

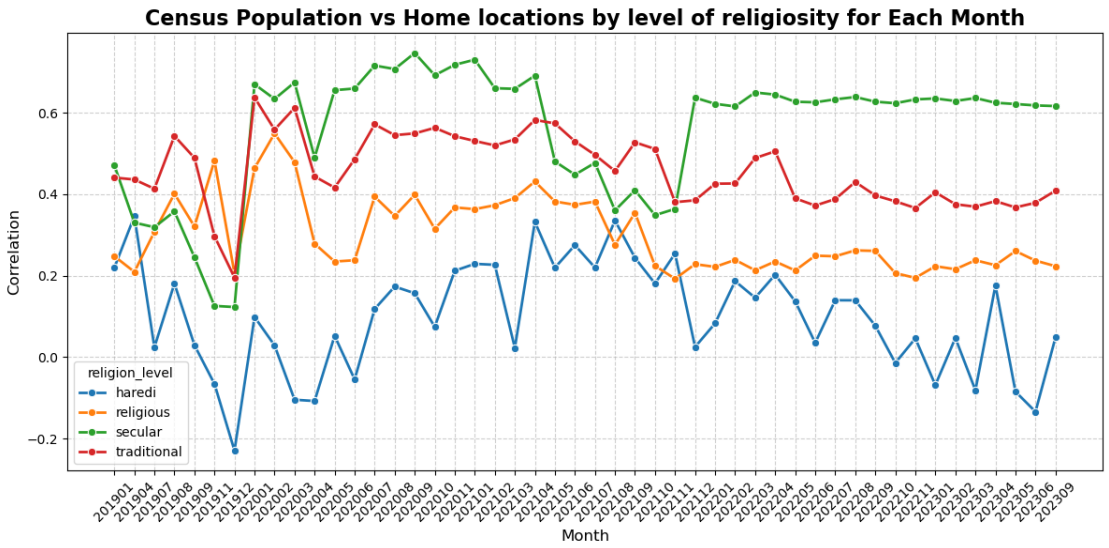

Frequency of signals changes between months, days and hours

Work From Home estimation

Identification of home locations

CRITERIA

Home location detection

- At least 2 hours between 8 pm and 9 am
- At least 1 signal on Shabbat
- The place with the highest number of night + Shabbat signals that satisfies these criteria

VALIDATION

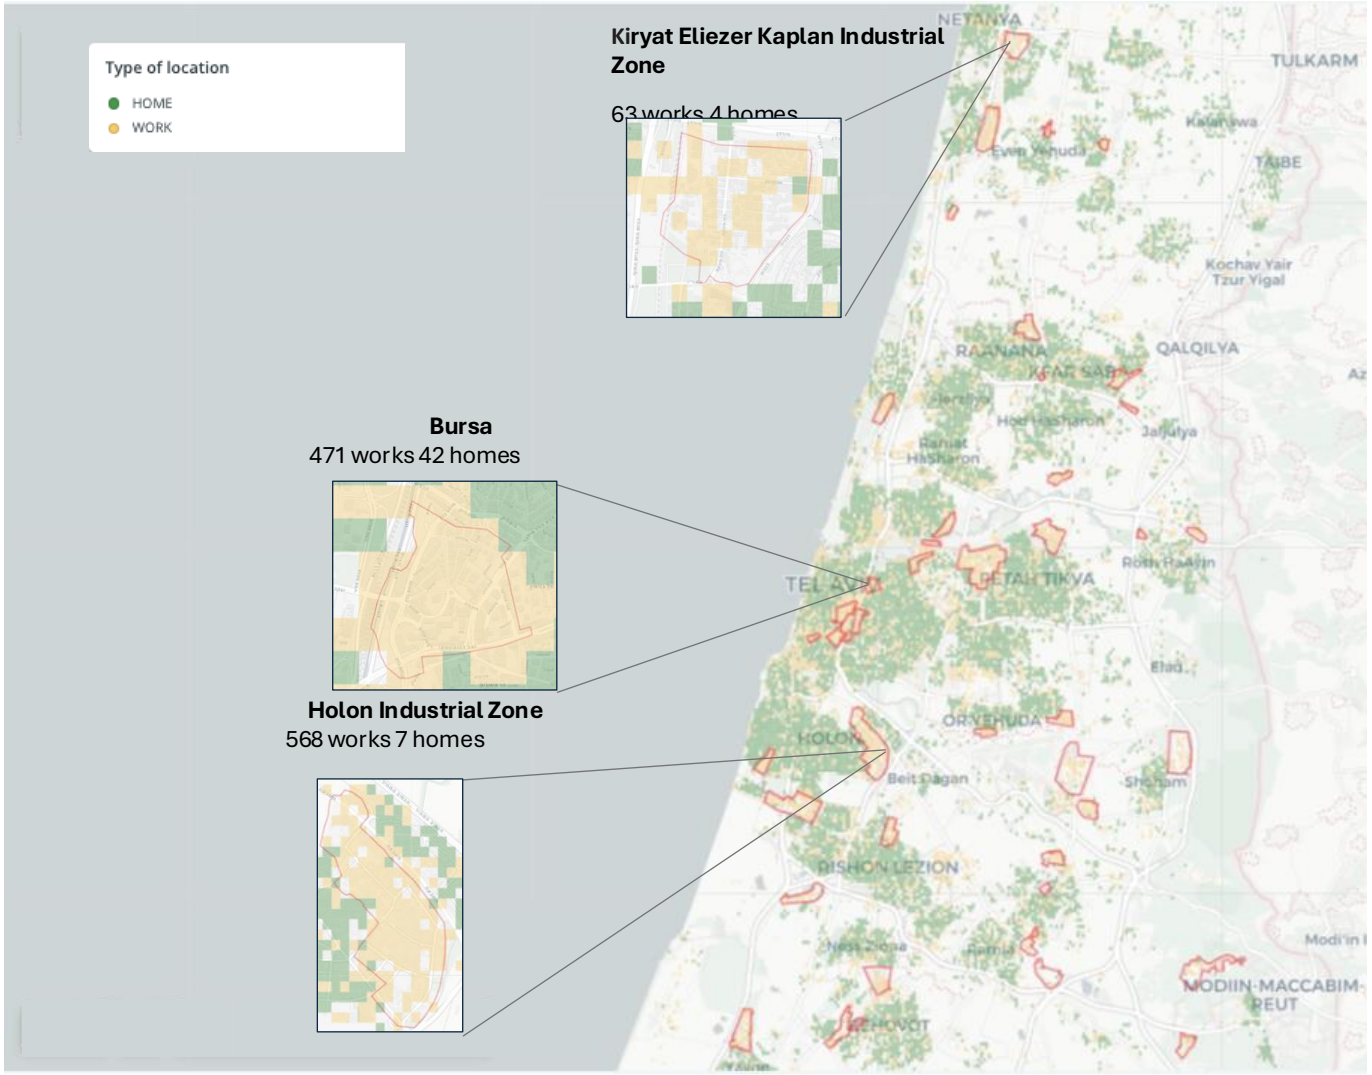

0.57

monthly correlation with census population across statistical areas

< 2 %

of homes attributed to a non-residential building

Detected work locations vs real work zones

CRITERIA

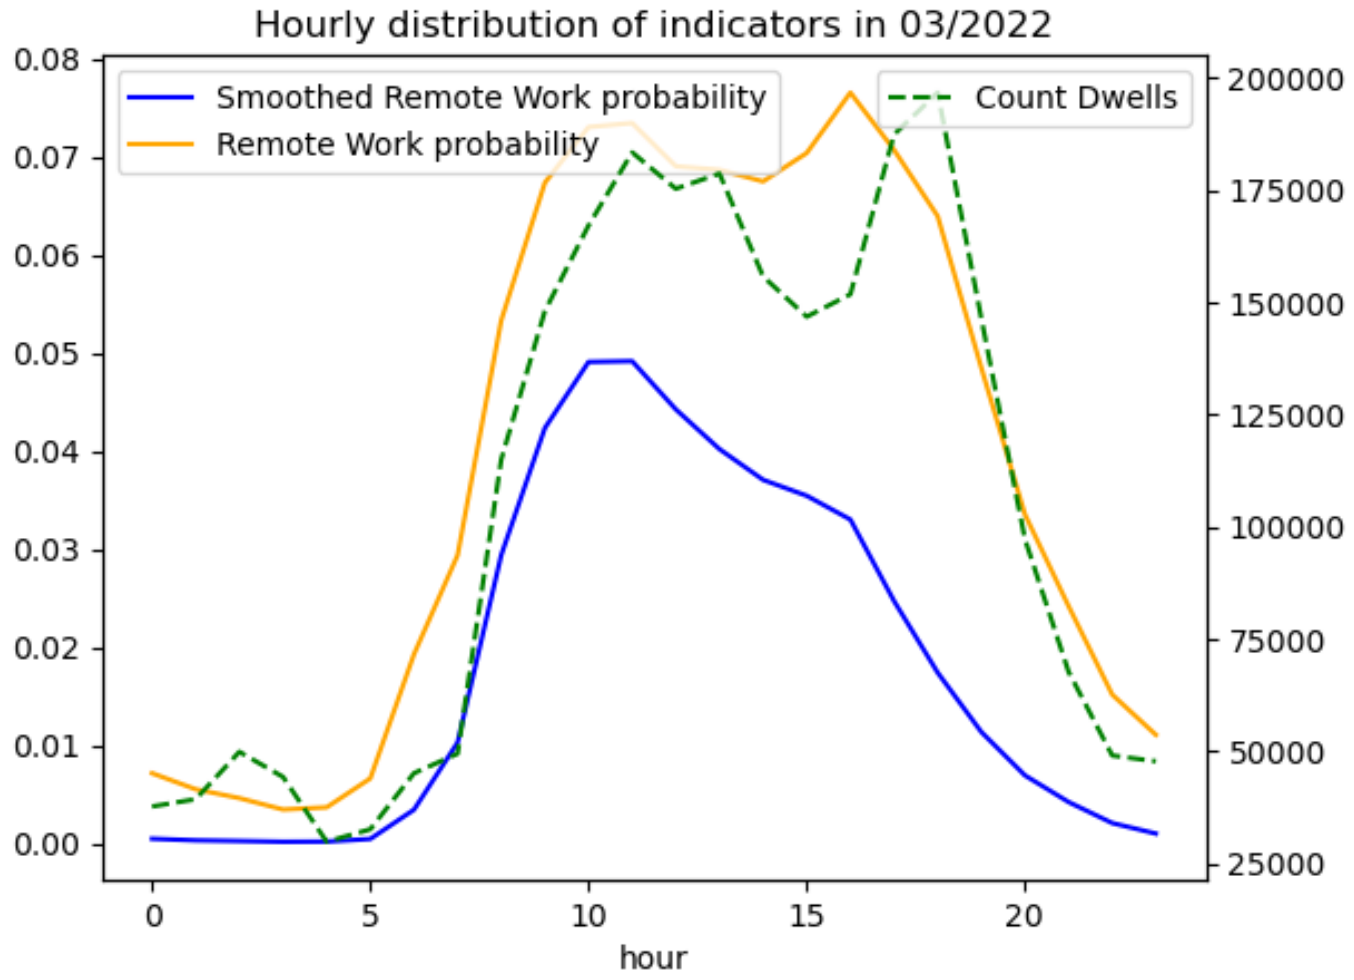

Work location detection

- No signals on weekends
- At least 3 hours and two days
- At least 1 km from home
- The place with the highest number of signals that satisfies these criteria

WORK LOCATION VS REAL WORK ZONES

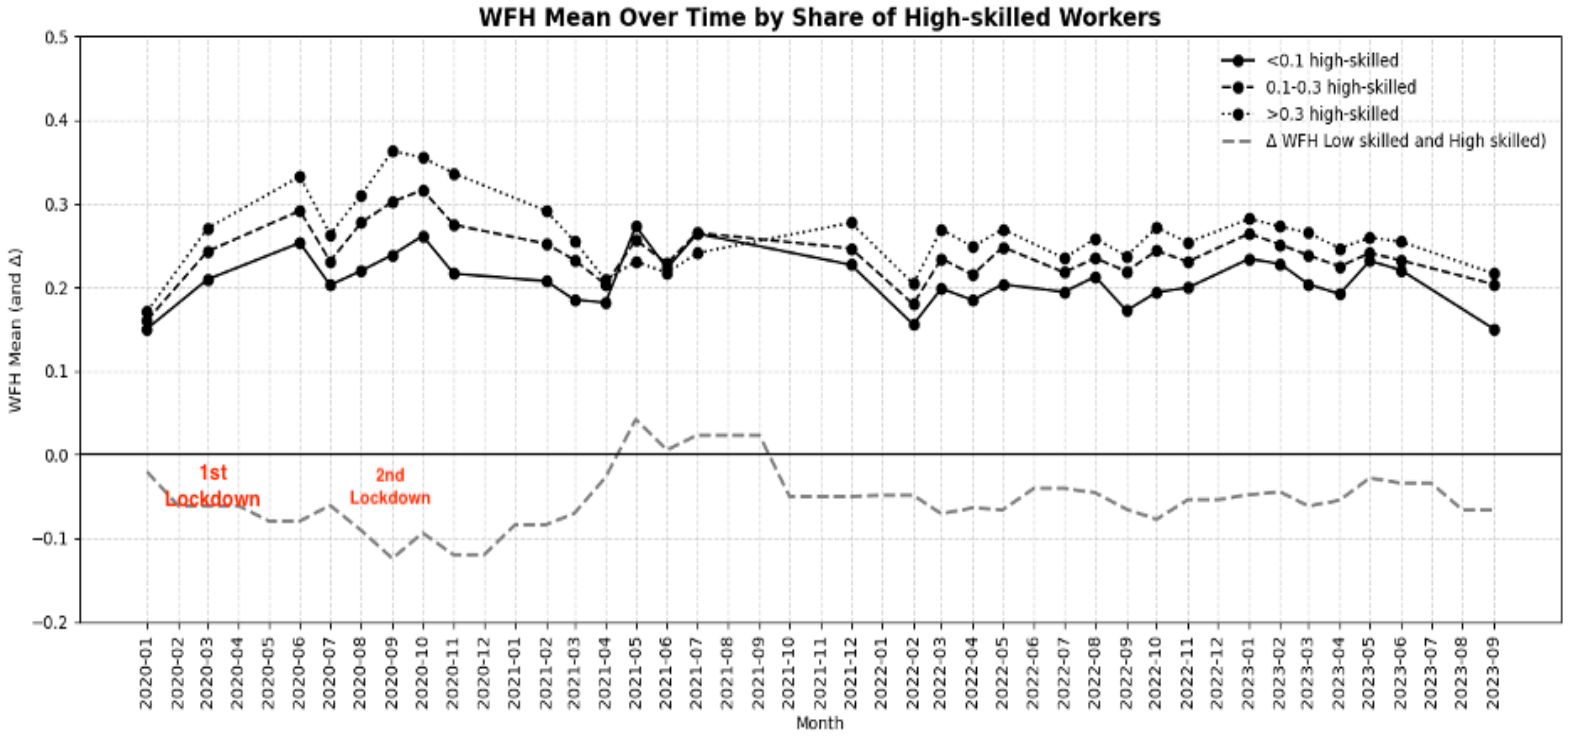

Real work zone	Estimated work location	Share
FALSE	FALSE	69%
	TRUE	31%
TRUE	TRUE	96%
	FALSE	4%

Third places visits detection

Points of interest · Google Places + OSM + Israel Census

CANDIDATE THIRD PLACES

CANDIDATE THIRD PLACES — **4,902**

Cafés, libraries, coffee shops, bakeries, museums, community & cultural centers, bookstores

Google Places API

WORK-ZONE & TRANSPORT HUBS — **-1,378**

Business centers, corporate offices, industrial areas, universities, schools

Google Places + OSM + Census

FINAL CANDIDATE THIRD PLACES — **3,524**

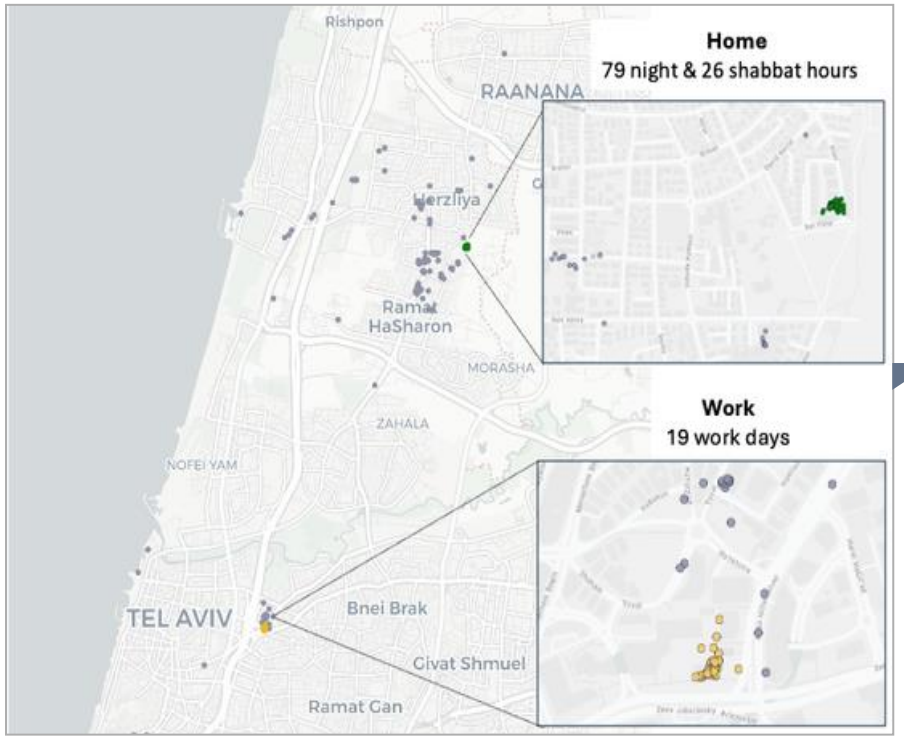

OTHER AMENITIES

Hospitals, Parks, Retail, Entertainment, Outdoor attractions, Lifestyle services — **~34K**

OpenStreetMap

Steps to classify visits on home/work/POI and other

1. Detecting users **home/work** monthly

Home:
>= 2 hours in 8pm -9 am
>=1 signal on Shabbat

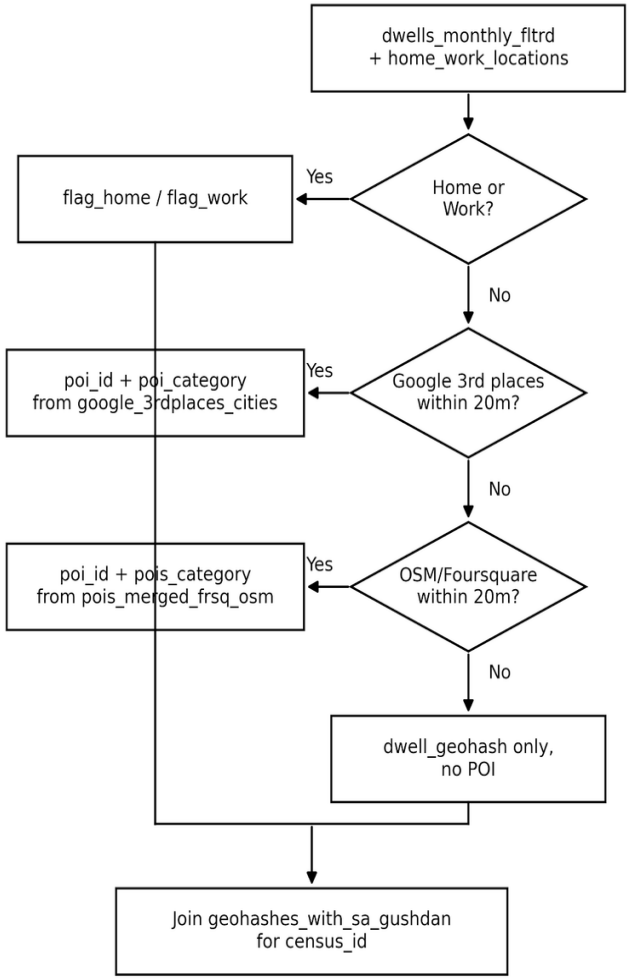

Work:
0 weekends
>=3 hours & 2 days
>=1km from home

2. Detecting **POIs** visits

Closest POI within 20m

Finalizing type of visit

METHODOLOGY · POSITIVE LABELS

Identifying third places using Google reviews

Review-derived features

-Number of reviews -Average Rating -Price range -Serve coffee -Restroom

Cultural center	**62**	15.8 %	100 %
bakery	**66**	5.9 %	33 %
Community center	**27**	11.1 %	—

Visitors Behavior. How do visits differ between third places and the rest?

STANDARDIZED BEHAVIOR DIFFERENCES

SIGNIFICANT DEVIATIONS

Longer visits + 0.15 σ

All Tel Aviv Metropolitan area

Distance from work – 0.16 σ

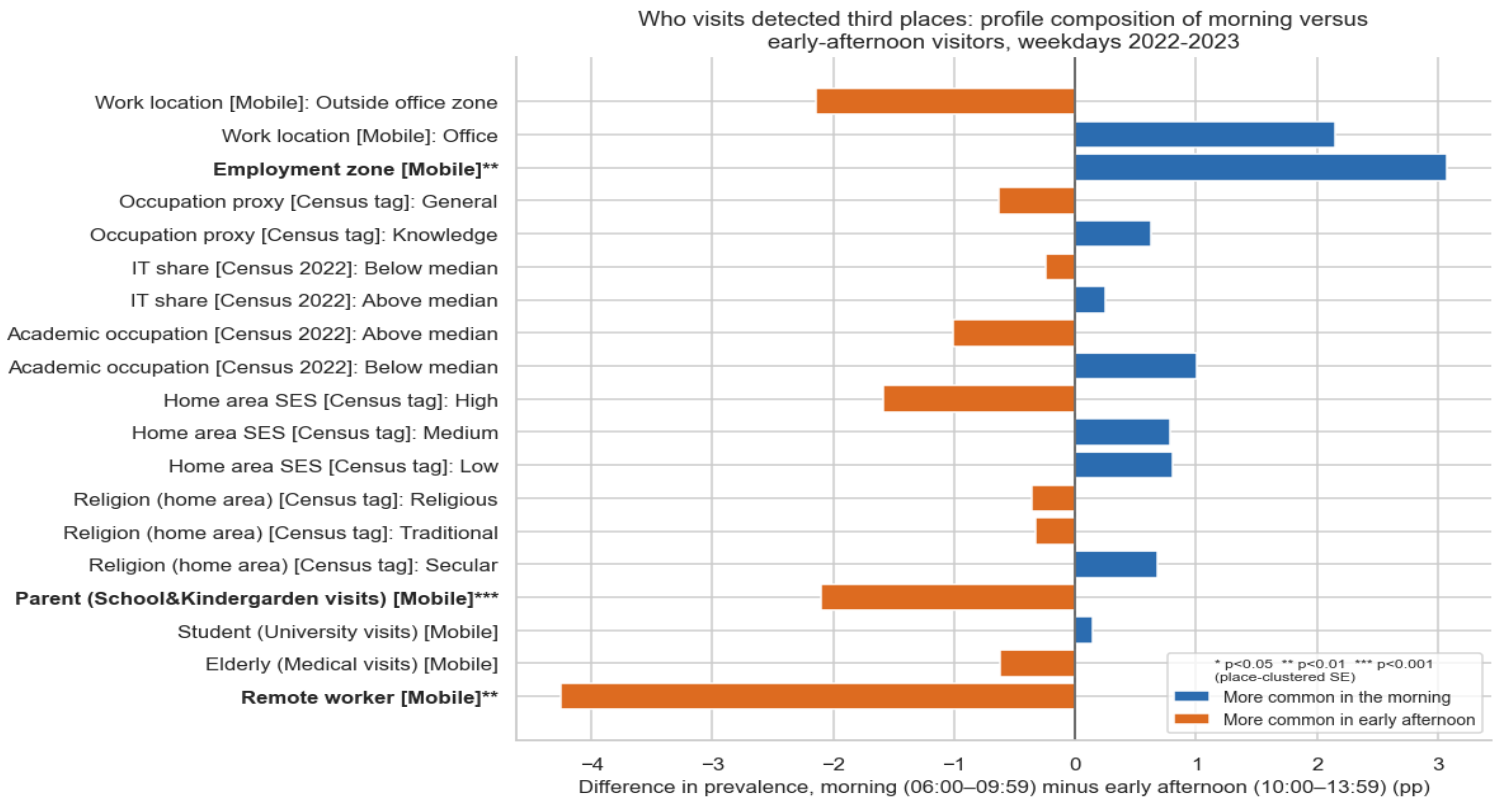

Only Tel Aviv

More long afternoon stays + 0.17 σ

Only satellite cities

Who are the visitors of the third places?

Prevalence of profile groups among morning visits (06:00 – 09:59) minus early-afternoon visits (10:00 – 13:59).

SIGNIFICANT GAPS

Remote workers ** — − 4 pp

Strongly under-represented in the morning window — they arrive in the early afternoon.

Parents on school run *** — − 2 pp

Strongly under-represented in the morning window — they arrive in the early afternoon.

Employment zone workers ** — + 3 pp

Office-anchored users pass through third places on their way to work in the morning.

OLS of group indicator on a morning dummy · SE clustered at place (poi_id) · * p<0.05 ** p<0.01 *** p<0.001

What GPS data can and cannot tell us

1 Granularity

GPS signals allow a temporal and spatial granularity of insights that is not available with traditional sources.

2 No human bias

Changes in residential dynamics can be understood without asking residents directly.

3 Not equally representative

The data naturally inherits biases that have to be considered: groups with lower smartphone use, such as the Haredi population, are underrepresented.
